

GridWorld image Push-T state Door image

Arms ordered by effect. Spread from Full S to Random 3: 2.25 points.
The ordering, not the individual gap, is the result.

Silhouette selection beats the best fixed k ($k = 3$) by 0.34 points.
The adaptivity is real (D2) but its value is small.

Top-3-by-loss against Full S: -0.40 points. $n = 5$ buys nothing over $n = 3$.
Top-1 omitted: bridging requires at least two cited failures.

Three step-level ablations with the same answer: each is worth roughly half a point. They are shown together so that none is oversold. Lift is omitted (at ceiling).
