

Friedman across the seven dimensionalities: $\chi^2(6) = 59.52$, $p = 5.6 \times 10^{-11}$. Wilcoxon 6-D vs 5-D: $p = 0.002$. 6-D vs 8-D: $p = 0.002$.

Silhouette is a criterion of geometric separation only and is independent of success rate. Clustering is geometric for every run, state and image alike.
